

# Bayesian data analysis – reading instructions 12

Aki Vehtari

## Chapter 12

Outline of the chapter 12

- 12.1 Efficient Gibbs samplers (not part of the course)
- 12.2 Efficient Metropolis jump rules (not part of the course)
- 12.3 Further extensions to Gibbs and Metropolis (not part of the course)
- 12.4 Hamiltonian Monte Carlo (used in Stan)
- 12.5 Hamiltonian dynamics for a simple hierarchical model (read through)
- 12.6 Stan: developing a computing environment (read through)

There are only 8 pages to read (sections 12.4–12.6) what is inside Stan.

R and Python demos at [https://avehtari.github.io/BDA\\_course\\_Aalto/demos.html](https://avehtari.github.io/BDA_course_Aalto/demos.html)

- demo12\_1 (in R): The No-U-Turn Sampler (NUTS) / Dynamic Hamiltonian Monte Carlo
- CmdStanR Demos [http://avehtari.github.io/BDA\\_R\\_demos/demos\\_rstan/cmdstanr\\_demo.html](http://avehtari.github.io/BDA_R_demos/demos_rstan/cmdstanr_demo.html)
- PyStan demos [https://github.com/avehtari/BDA\\_py\\_demos/blob/master/demos\\_pystan/pystan\\_demo.ipynb](https://github.com/avehtari/BDA_py_demos/blob/master/demos_pystan/pystan_demo.ipynb)

## MCMC animations

These don't include the specific version of dynamic HMC in Stan, but are useful illustrations anyway.

- demo12\_1 (in R): The No-U-Turn Sampler (NUTS) / Dynamic Hamiltonian Monte Carlo
- Markov Chains: Why Walk When You Can Flow?  
<http://eleventh.org/blog/2017/11/28/build-a-better-markov-chain/>
- MCMC animation site by Chi Feng <https://chi-feng.github.io/mcmc-demo/>

## Hamiltonian Monte Carlo

An excellent review of static HMC (the number of steps in dynamic simulation are not adaptively selected) is

- Radford Neal (2011). MCMC using Hamiltonian dynamics. In Brooks et al (ed), *Handbook of Markov Chain Monte Carlo*, Chapman & Hall / CRC Press. Preprint <https://arxiv.org/pdf/1206.1901.pdf>.

Stan uses a variant of dynamic Hamiltonian Monte Carlo (using adaptive number of steps in the dynamic simulation), which has been further developed since BDA3 was published. The first dynamic HMC variant was NUTS

- Matthew D. Hoffman, Andrew Gelman (2014). The No-U-Turn Sampler: Adaptively Setting Path Lengths in Hamiltonian Monte Carlo. *JMLR*, 15:1593–1623 <http://jmlr.org/papers/v15/hoffman14a.html>.

The No-U-Turn Sampler gave the name NUTS which you can see often associated with Stan, but the current variant implemented in Stan has some further developments described (mostly) in

- Michael Betancourt (2018). A Conceptual Introduction to Hamiltonian Monte Carlo. arXiv preprint arXiv:1701.02434 <https://arxiv.org/abs/1701.02434>.

## Divergences and BFMI

- Divergence diagnostic checks whether the discretized dynamic simulation has problems due to fast varying density. See more in a case study [http://mc-stan.org/users/documentation/case-studies/divergences\\_and\\_bias.html](http://mc-stan.org/users/documentation/case-studies/divergences_and_bias.html)
- Brief Guide to Stan's Warnings <https://mc-stan.org/misc/warnings.html> provides summary of available convergence diagnostics in Stan, and how to interpret them, and suggestions for solving sampling problems.

## Further information about Stan

- <http://mc-stan.org/> & <http://mc-stan.org/documentation/>
  - I recommend to start with these
    - \* Bob Carpenter, Andrew Gelman, Matt Hoffman, Daniel Lee, Ben Goodrich, Michael Betancourt, Marcus A. Brubaker, Jiqiang Guo, Peter Li, and Allen Riddell (2015) In press for Journal of Statistical Software. Stan: A Probabilistic Programming Language. <http://www.stat.columbia.edu/~gelman/research/published/stan-paper-revision-feb2015.pdf>
    - \* Andrew Gelman, Daniel Lee, and Jiqiang Guo (2015) Stan: A probabilistic programming language for Bayesian inference and optimization. In press, Journal of Educational and Behavior Science. [http://www.stat.columbia.edu/~gelman/research/published/stan\\_jebbs\\_2.pdf](http://www.stat.columbia.edu/~gelman/research/published/stan_jebbs_2.pdf)

  - Modeling Language User's Guide and Reference Manual (more complete reference with lot's of examples) <https://github.com/stan-dev/stan/releases/download/v2.17.0/stan-reference-2.17.0.pdf>

## Compiler and transpiler

This is a minor comment on the terminology. As a shorthand it's common to see mentioned just Stan compiler, but sometimes the transpiler term is also mentioned as in the slides for this part.

Wikipedia ([https://en.wikipedia.org/wiki/Source-to-source\\_compiler](https://en.wikipedia.org/wiki/Source-to-source_compiler)):

*A source-to-source translator, source-to-source compiler (S2S compiler), transcompiler, or transpiler[1] is a type of translator that takes the source code of a program written in a programming language as its input and produces an equivalent source code in the same or a different programming language. A source-to-source translator converts between programming languages that operate at approximately the same level of abstraction, while a traditional compiler translates from a higher level programming language to a lower level programming language.*

So it is more accurate to say that the Stan model code is first transpiled to a C++ code, and then that C++ code is compiled to machine code to create an executable program. Cool thing about the new

stanc3 transpiler (<https://github.com/stan-dev/stanc3>) is that it can create also, for example, LLVM IR or Tensorflow code.

Using transpiler and compiler allows to develop Stan language to be good for writing models, but get the benefit of speed and external libraries of C++, Tensorflow, and whatever comes in the future.
